AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions of claims in the application:

Listing of Claims:

- 1. (Previously Presented) A distinct count query system implemented on a machine comprising:
 - a query process component to retrieve a plurality of partitions from a database;
- a range component that determines the maximum and minimum values associated with each partition; and
- a group component that utilizes the maximum and minimum range values to determine independent partitions or partition groups, wherein independent partitions or partition groups are executed concurrently with other partitions.
- 2. (Original) The system of claim 1, wherein the database is an OLAP database.
- 3. (Original) The system of claim 1, further comprising a buffer component to facilitate execution of the distinct count query on sections of the partitions.
- 4. (Original) The system of claim 1, wherein the partitions contain one or more numeric identifiers.
- 5. (Original) The system of claim 4, wherein the numeric identifiers are ordered in ascending order from smallest to largest value.
- 6. (Original) The system of claim 5, wherein the numeric identifier is a customer ID.
- 7. (Original) The system of claim 5, wherein the numeric identifier is a product ID.

- 8. (Original) The system of claim 1, wherein partitions with overlapping ranges are executed in parallel.
- 9. (Previously Presented) A distinct query system comprising:
 - a means for receiving partitions from a database;
 - a means for identifying independent partition groups; and
 - a means for executing independent partitions in parallel with other partitions.
- 10. (Original) The system of claim 9, wherein identifying independent partition groups comprises a means for determining a range of partition data.
- 11. (Original) The system of claim 10, wherein the independent partition groups have a non-overlapping range with respect to other partitions.
- 12. (Original) The system of claim 9, wherein partitions in the partition group contain ordered numeric identifiers.
- 13. (Previously Presented) The system of claim 9, wherein the database is a multidimensional database.
- 14. (Previously Presented) A machine implemented method for executing a distinct count query comprising:

determining ranges associated with partition data;

identifying independent partitions based on the partition ranges; and

executing a distinct count query on a partition group concurrently with other partitions to be queried.

- 15. (Original) The method of claim 14, wherein partition data includes numeric identifiers.
- 16. (Original) The method of claim 15, wherein the numeric identifiers are ordered in partitions.

- 17. (Original) The method of claim 16, wherein the identifiers are ordered in ascending order.
- 18. (Original) The method of claim 17, wherein the ranges are determined by retrieving the first and last values from each partition.
- 19. (Original) The method of claim 18, wherein an independent partition group includes one or more partitions that have non-overlapping ranges with respect to other partitions or partition groups to be queried.
- 20. (Original) The method of claim 19, wherein partitions with overlapping ranges are executed in parallel.
- 21. (Previously Presented) A tangible computer readable medium having stored thereon computer executable instructions for carrying out the method of claim 14.
- 22. (Previously Presented) A machine implemented method for executing a distinct count query on a database comprising:

pre-aggregating database data;

determining a minimum and maximum range of a plurality of data partitions; and identifying independent partition groups to be executed simultaneously with other queried partitions, the independent partition groups including one or more partitions with a non-overlapping range with respect to other queried partitions.

- 23. (Original) The method of claim 22, wherein pre-aggregating database data comprises separating data into partitions.
- 24. (Original) The method of claim 23, wherein data is separated automatically based on heuristics associated with the database.

- 25. (Original) The method of claim 23, wherein pre-aggregating database data comprises ordering partition data.
- 26. (Cancelled)
- 27. (Original) The method of claim 22, wherein pre-aggregating database data comprises eliminating redundant data in each partition.
- 28. (Original) The method of claim 22, wherein the other queried partitions include overlapping ranges which are executed synchronously and in parallel.
- 29. (Original) The method of claim 22, further comprising executing the distinct count query on sections of partitions utilizing a buffer.
- 30. (Original) The method of claim 22, the database is an OLAP database.
- 31. (Previously Presented) A tangible computer readable medium having stored thereon computer executable instructions for carrying out the method of claim 22.
